

VT705P

Self-contained Test Transmitter

Test system

The remote test transmitter VT705P, connected to the detector via a plug, is used to test the functionality and mounting of the seismic detectors. The test system consists of a test generator inside the seismic detectors VV600/602-Plus and the crystal unit VT705P which is mounted on the protected object, inside the detector housing.

Two test possibilities

There are two possibilities of testing; internal test of the detectors electronic or a function test of the detector and its physical contact to the protected object.

Details

- Function test of the seismic detector
- Connected to detector via a plug
